

EXPERIMENT-4

Name:- Julakanti Sravani

Roll No:- 241210052

Branch:- CSE-1

Subject:- Computer Architecture and Organization

Subject code:- CSBB 251

Aim:- To convert binary to decimal and vice versa using shift register

Software tools used:-

Logisim

Theory:-

- A shift register is a fundamental sequential logic circuit used in digital electronics to store and move binary data.
- It is constructed by cascading multiple flip-flops (typically D flip-flops) in a chain, where the output of one flip-flop is connected to the input of the next.
- These circuits are synchronized by a shared clock signal. With every clock pulse, the data stored within the register is shifted by one bit position, either to the left or to the right, depending on the design.

Procedure:-

Conclusion:-

Hence we successfully designed shift register to convert binary to decimal and decimal to binary
